observed in all groups were hunched posture, rough coat, hyperactivity, inactivity, and increased rate and/or depth of respiration. Body weights were unaffected by the dosing and no gross or microscopic lesions could be attributed to HSD or its constituents. These data suggest that the maximum tolerated dose of HSD following acute intravenous administration is less than 28 ml/kg, and that the toxicity associated with HSD is consistent with the administration of large volumes of hypertonic saline. Since the proposed therapeutic dose of HSD is only 4 ml/kg, these findings indicate that there will be minimal adverse effects associated with the therapeutic administration of HSD.

ABSTRACT

The acute toxicity following intravenous administration of a proposed new resuscitation fluid, hypertonic saline/Dextran 70® (HSD), was evaluated in male and female ICR mice. Animals were administered a single intravenous dose of HSD, 28 ml/kg over a 5-minute period, in an attempt to define its maximum tolerated dose. Equal volumes of each HSD component, 7.5% hypertonic saline (HS) and 6% Dextran 70® (D70) in normal saline, and Ringer's lactate (RL) were also evaluated. Observations were made at 1, 2, and 4 hours after administration on the day of dosing and twice daily for the remainder of the study. The animals in each group were divided into two subgroups based on whether they were submitted to necropsy on Day 3 or Day 14 after dosing. HSD produced death within 12 minutes of the injection in 2 of 20 mice, pale eyes, and tail sloughing, findings similar to those observed with HS. Major signs observed in all groups were hunched posture, rough coat, hyperactivity, inactivity, and increased rate and/or depth of respiration. Body weights were unaffected by the dosing and no gross or microscopic lesions could be attributed to HSD or its constituents. These data suggest that the maximum tolerated dose of HSD following acute intravenous administration is less than 28 ml/kg, and that the toxicity associated with HSD is consistent with the administration of large volumes of hypertonic saline. Since the proposed therapeutic dose of HSD is only 4 ml/kg, these findings indicate that there will be minimal adverse effects associated with the therapeutic administration of HSD.

Veterinary Preventive Medicine

CO-PRINCIPAL INVESTIGATOR: Gary M. Zaucha, DVM, CPT, VC

PATHOLOGIST: G. David Young, DVM, MAJ, VC

DATA MANAGER: Yvonne C. LeTellier, BS

REPORT AND DATA MANAGEMENT: A copy of the final report,
study protocols, retired SOPs,
raw data, analytical and
stability data, and an aliquot
of the test compound will be
retained in the LAIR Archives.

TEST SUBSTANCE: Hypertonic Saline/Dextran 70®

INCLUSIVE STUDY DATES: 25 May 88 - 28 Jun 88

OBJECTIVE: The objective of this study was to determine
the acute toxicity of hypertonic saline/Dextran
70® following intravenous administration in male
and female ICR mice.

ACKNOWLEDGMENTS

SPC Dean K. Magnuson, BS, SPC Eric Dahlberg, BS, and SPC Wilmar O. L. Villa provided assistance in dose preparation and administration; SGT Tammie Heineman, SGT Barbara D. Green, and Richard Katona provided data collection, animal care, and facility management.

SIGNATURES OF PRINCIPAL SCIENTISTS AND MANAGERS
INVOLVED IN THE STUDY

We, the undersigned, declare that GLP study number 88001 was performed under our supervision, according to the procedures described herein, and that this report is an accurate record of the results obtained.

MEMORANDUM FOR RECORD

SUBJECT: GLP Compliance for GLP Study 88001

1. This is to certify that in relation to LAIR GLP Study 88001, the following inspections were made:

27 January 1988	- Protocol Review
01 June 1988	- Animal Receipt/Room Inspection
09 June 1988	- Randomization
13 June 1988	- Dosing
13 June 1988	- Observations
15 June 1988	- Test Chemical Log
16 June 1988	- Interim Sacrifice
20 June 1988	- Weighing
27 June 1988	- Final Sacrifice
14 July 1988	- Histology

2. The institute report entitled "Acute Intravenous Toxicity Study of Hypertonic Saline/Dextran 70® and Its Constituents in ICR Mice," Toxicology Series 245, was audited on 9 December 1988.

**Acute Intravenous Toxicity Study of Hypertonic
Saline/Dextran 70® and Its Constituents in ICR Mice --**
Frost et al

INTRODUCTION

During conventional land warfare it has been estimated that 90% of the deaths occur either in the field or en route to a fixed medical treatment facility and that 50% of those deaths occur due to hemorrhage (1). Conventional treatment of hemorrhage has involved infusion of isotonic resuscitation fluids at volumes equivalent to two or three times the volume of blood lost (2). Supplying this volume of resuscitation fluid on the battlefield for treatment of multiple casualties is not feasible.

Hypertonic crystalloid solutions have been used for the past 70 years in the treatment of hemorrhage (3). However, the consensus has been that unless followed by replacement of the lost blood volume, the beneficial effects of treatment with hyperosmotic solutions are transient (4). Recently, the addition of a hyperoncotic colloid, 6% Dextran 70®, to the hypertonic crystalloid, 7.5% saline, has significantly extended 96-hour survival rates compared with those obtained with normal saline or 7.5% saline (5). If the effectiveness of this hypertonic saline/Dextran therapy is verified by clinical trial, it would be a significant advance in the treatment of blood loss due to traumatic injuries.

As with any new treatment regimen, there are potential risks. Low molecular weight dextran may cause bleeding abnormalities and phlebitis or interfere with the cross-matching of blood (6). Hypertonic solutions may cause neurologic abnormalities induced by the rapid increases in osmolalities (7-9) or cardiac arrhythmias induced by the hypokalemia associated with the rapid expansion of extracellular space (2, 10). Consequently, the Division of Toxicology, Letterman Army Institute of Research, was tasked to provide an acute and subchronic toxicity profile of the 7.5% hypertonic saline/6% Dextran 70® resuscitation fluid (HSD). This report describes the results of an acute toxicity study of hypertonic saline/Dextran 70® following intravenous administration of the maximum tolerated dose in male and female ICR mice.

Objective of Study

The objective of this study was to determine the acute toxicity of hypertonic saline/Dextran 70® following intravenous administration in male and female ICR mice.

MATERIALS

Test Substance

Name: Hypertonic saline/Dextran 70® (HSD)

LAIR Compound Code: TP96

Lot Number: NC 54845

Expiration Date: 31 December 1988

Composition per 100 ml: Dextran 70® 6 g
sodium chloride 7.5 g
water for injection to 100 ml

Source: Pharmacia LEO Pharmaceuticals
Uppsala, Sweden

Test Substance Constituents

Name: Hypertonic (7.5%) saline (HS)

LAIR Compound Code: TP98

Lot Number: I 318712

Expiration Date: 31 December 1988

Composition per 100 ml: sodium chloride 7.5 g
water for injection to 100 ml

Source: Pharmacia LEO Pharmaceuticals
Uppsala, Sweden

Name: Dextran 70® (D70)

LAIR Compound Code: TP95

Lot Number: NE 54941

Expiration Date: 31 May 1989

Composition per 100 ml: Dextran 70® 6 g
 sodium chloride 0.9 g
 water for injection to 100 ml

Source: Pharmacia LEO Pharmaceuticals
Uppsala, Sweden

Control

Name: Ringer's lactate (RL)

LAIR Compound Code: TP97

Lot Number: NC 54847

Expiration Date: 31 December 1988

Composition per 100 ml: sodium chloride 600 mg
 potassium chloride 30 mg
 calcium chloride
 dihydrate 20 mg
 sodium lactate 310 mg
 water for injection to 100 ml

Source: Pharmacia LEO Pharmaceuticals
Uppsala, Sweden

Other test substance information is presented in
Appendix A.

Animal Data

Forty-two male and 42 female ICR mice (Harlan Sprague-Dawley, Inc., P.O. Box 29176, Indianapolis, IN 46229) were assigned to this study. They were identified individually with neck tags. Two male and 2 female mice were utilized for quality control necropsy. The animal weights on receipt (25 May 88) ranged from 16.5 to 26.9 g. Additional animal data are presented in Appendix B.

Husbandry

Study animals were individually housed in stainless steel battery-type cages with screen bottoms, in racks equipped with automatically flushing dump tanks. The diet, fed *ad libitum*, consisted of Purina Rodent Laboratory Chow® 5001 (Ralston Purina Company, St. Louis, MO); water, purified by reverse osmosis, was provided by continuous drip from a central line. The animal room temperature and humidity were monitored continuously by hygrothermograph. The temperature

was maintained in a range from 23.3°C to 30.0°C. The relative humidity was maintained in a range of 29% to 47% with occasional spikes to as high as 63% during room cleaning. The photoperiod was 12 hours of light per day (0600 - 1800 hours).

METHODS

This study was conducted in accordance with FDA guidelines (11) and LAIR SOP-OP-STX-113, "Acute Intravenous Toxicity Study" (12).

Group Assignment/Acclimation

The animals were randomized into four groups of 10 males and 10 females each. Since animals were to be terminated at two different time intervals following dosing, each group was further divided into 2 subgroups of 5 males and 5 females each (Table 1). Allocation was accomplished using a computer-based, stratified, weight-biased method. The XYBION Path/Tox AESLCT Animal Allocation Program was used in conjunction with a VAX 750 Computer.

Table 1
DOSE GROUPS

Group/Subgroup	Solution	Sacrifice Day
1/1	hypertonic saline/Dextran 70®	3
1/2	hypertonic saline/Dextran 70®	14
2/1	hypertonic saline	3
2/2	hypertonic saline	14
3/1	Dextran 70/normal saline	3
3/2	Dextran 70/normal saline	14
4/1 (controls)	Ringer's lactate	3
4/2 (controls)	Ringer's lactate	14

The male and female study animals were acclimated for 18 and 19 days, respectively, before the day of dosing. During this period they were checked daily for signs of illness, and weighed weekly.

Dose Levels, Preparation, and Analysis

The maximum tolerated intravenous dose of HSD administered over a 5-minute period was determined to be 28 ml/kg in preliminary pilot studies. Equal volumes of HS, D70, and RL were administered to animals in the corresponding dose groups. Solutions were used as supplied by the manufacturer, Pharmacia LEO Pharmaceuticals. Analysis of the dosing solutions was provided by Pharmacia LEO Pharmaceuticals. Additional chemical data are presented in Appendix A.

Test Procedures

The acute intravenous toxicity of hypertonic saline/Dextran 70® (HSD) was evaluated in parallel with solutions of its major constituents, hypertonic (7.5%) saline (HS) and Dextran 70® (6%) in normal saline (D70), with Ringer's lactate (RL) serving as the control. The dosing solutions were administered via the tail veins. Injections were made using tuberculin syringes (Becton Dickinson & Co., Rutherford, NJ 07070, Lot No. 7H355) and 26 gauge, 1/2 inch needles (Becton Dickinson & Co., Rutherford, NJ 07070, Lot No. 1D017). A 12-inch length of PE-20 polyethylene tubing (Clay Adams, Division of Becton Dickinson & Co., Parsippany, NJ 07054, Lot No. 91198, exp. date 8/92) was used to attach a second, hubless needle to the needle on the syringe to facilitate completion of the injections. Immediately following the injection, digital pressure was applied to control any bleeding from the injection site.

Observations

Clinical observations were accomplished 1, 2, and 4 hours after dosing on Day 0, and then at least twice daily for the remainder of the observation period. Body weights were recorded upon receipt of the animals, weekly during the quarantine and observation periods, before dosing, and at necropsy.

Necropsy

Animals that died spontaneously after dosing were immediately submitted for necropsy. Subgroups 1 and 2 animals were submitted for necropsy on Days 3 and 14,

respectively, immediately after sacrifice by barbiturate overdose. Histopathology was performed on the heart, liver, kidney, brain, lung, spleen, and all gross lesions.

Statistical Analysis

Clinical signs were tabulated by groups. The means and standard errors for the body weights for each group were calculated. For Day 0, the equality of the variances for the groups was tested by the Levene test. If equal, the standard one-way analysis of variance was performed. If unequal, the Welch's one-way analysis of variance was performed. For Days 3, 7, and 14, an analysis of covariance was performed with Day 0 body weights as the covariate. If the F-statistic was significant for an analysis of variance or covariance for a particular measurement, differences among the groups were evaluated using the Newman-Keuls test (13). Gross and microscopic pathology findings were described for each animal and tabulated by groups.

Duration of Study

Appendix C is a complete listing of historical events.

Changes/Deviations

The diet consisted of Purina Rodent Laboratory Chow® #5001 instead of Certified Rodent Chow® #5002.

The animal room lights were found on at 2148 hours, 11 Jun 88.

Animals 88C00-01, -08, and -38 of Group 1 were misdosed and received 40 ml/kg HSD instead of 28 ml/kg. Since 88C0008 tolerated the dose, it was not deleted from the data tabulation. Animals 88C00-01 and -38 died from the overdose and were replaced by 88C00-48 and -42, respectively. Due to the nature of XYBION programming, it was not possible to change animal numbers. As a result, the pathology data for these two animals appear under the number of the animal each replaced.

Some tissues were not available for histological evaluation because they were lost or not processed correctly. The following tissues were not available for animal 88C0094: brain, liver, heart, spleen and kidneys.

It is believed that these changes had no adverse effects on the results of this study.

Storage of Raw Data and Final Report

A copy of the final report, study protocol, raw data, retired SOPs, and an aliquot of the test compound will be retained in the Letterman Army Institute of Research Archives.

RESULTSClinical Observations

The clinical signs observed were grouped into the following categories: general health, respiratory, behavioral, ocular, reflexive, and miscellaneous.

The most frequently observed signs were in the general health category. Hunched posture (65 of 80 animals) was observed on Day 0 (day of dosing) and was observed in females and males through Days 3 and 4, respectively. Rough coat (36 of 80) was observed on Day 0 in both sexes but predominantly in the males. Rough coat was present through Days 3 and 7 for females and males, respectively. Bruising of the tail was observed in eleven animals (seven males and four females) from both the HSD- and HS-treated groups. Eventual sloughing of the tail distal to the injection site occurred in two HSD and three HS animals. Two HSD animals and one HS animal died within 12 minutes of the start of the infusion.

The second major category of clinical signs observed in the study were respiratory. Increased respiratory rate was observed in 65 of 80 animals on Day 0. The increased respiratory rate was observed until Day 3 in the females and in a majority of male animals; however, there were isolated occurrences of increased respiratory rate in some males observed through Day 7. The increase in respiratory depth was observed in 12 of 80 animals. The increase in respiratory depth occurred primarily on Day 0 in animals receiving HS or D70.

Ocular signs were observed in 23 of 80 animals. The eyes of these animals became pale or a lighter red in color. The pale eyes were observed only on Day 0 and were seen with increased incidence in the groups receiving D70, HSD, and HS compared with the controls.

Behavioral, reflexive, and miscellaneous signs were equally distributed among all groups. Behavioral signs observed included inactivity, hyperactivity, irritability, apprehension, circling, tremors, disorientation, and ataxia.

Only inactivity (16 of 80) and hyperactivity (13 of 80) occurred in an appreciable number of animals. The other behavioral signs were isolated and occurred sporadically among the different groups. Increased startle reflex (reflexive) and nasal staining (miscellaneous) were each observed in one animal.

Table 2 contains a summary of clinical observations. Appendix D contains individual animal histories.

Body Weights

Animal body weights were not significantly ($p \leq 0.05$) affected by dosing. Table 3 presents the mean body weights by group. Appendix E contains individual weight tables.

Necropsy Findings

No gross or microscopic pathological lesions attributable to the test compound or its constituents were reported. The Veterinary Pathologist's report is presented in Appendix F.

DISCUSSION

The acute intravenous toxicity of HSD in mice was evaluated by dosing the animals with an apparent maximum tolerated dose via the tail vein. This dose was established in preliminary studies as 28 ml/kg administered over 5 minutes. This dose, 28 ml/kg, is seven times the proposed therapeutic dose of 4 ml/kg (2). When administered at a rate of 28 ml/kg over 5 minutes, HSD caused death in 1 of 10 males and 1 of 10 females. This suggests that the maximum tolerated dose is less than 28 ml/kg. In addition to dosing with HSD, groups of mice were dosed with equal volumes of HS, D70, or RL. The HS also caused a death in 1 of 10 males dosed which suggests that the HS component is responsible for the lethality of the HSD mixture. The deaths were very rapid occurring within 1 - 12 minutes of the initiation of the infusion. The rapidity of onset and the fact that death was observed only in those groups receiving hypertonic saline suggest that the deaths were due to cardiac dysrhythmias arising from the putative hypokalemia produced by the saline infusions. This is consistent with the observation that dextran is well tolerated when administered intravenously at doses up to 40 ml/kg in various animal models (G. Jonsson, Pharmacia Pharmaceuticals AB, personnel communication).

† Day 3 body weights include only interim sacrifice animals.

* Data presented as mean ± standard deviation with the number of animals, n, in parenthesis.

* Days for females = -19, -14, -8, 0, 3, 6, 14.

An equal volume of RL was administered as a control. Since the RL is an isotonic solution it would only permit comparison of the effects of the volume administered. Therefore, differences between the RL group and the HSD, HS, and D70 groups would be attributable to the volume expansion capabilities of the latter groups. The majority of clinical signs whether general health, behavioral, respiratory, reflexive, or miscellaneous in nature, were observed at an equal rate of occurrence in each of the four groups. The two observations, other than death, associated primarily with the volume expanders were pale eyes and tail sloughing. In albino mice, the reddish color of the eyes is associated with the concentration of erythrocytes in the highly vascular retina; thus, the "pale eye" observation would suggest a reduction (or dilution) in the erythrocyte concentration. The increased incidence of pale eyes in the HSD, HS, and D70 groups compared with the LR group is attributed to the hyperosmotic action of these solutions to draw additional fluid into the vascular compartment resulting in a greater dilution of erythrocytes as compared with the LR group. The pale eyes were observed only within the first 24 hours of fluid administration suggesting that fluid balance had returned to normal within this time.

The tail sloughing occurred in two animals receiving HSD and three animals receiving HS. This was attributed to unavoidable extravasation of injection fluid around the site of injection. Assuming that the injection technique was the same for all animals, extravasation occurred in all dose groups. Tail sloughing in HSD and HS, but not in D70 treated animals, suggests that extravascular hypertonic saline causes tissue necrosis by a direct effect rather than indirectly through an increase in extravascular fluid pressure occluding perfusion. The resulting sloughing of the tail distal to the injection site was a consequence of the local necrosis. This finding was unexpected as HSD was not irritating following intravenous, intra-arterial, paravenous, subcutaneous, and intramuscular administration when evaluated in a standard irritation test system (14).

No significant findings associated with any treatment regimen were observed during necropsy at 3 or 14 days after injection of the dosing fluids nor in the histological examination of selected tissues. This suggests that morphological changes, if, in fact, there were any due to the administration of the volume expanders, were transient.

These data suggest that the maximum tolerated dose of HSD when administered intravenously over a 5-minute period is less than 28 ml/kg. The toxicity observed (death in 2 of 20 animals, pale eyes, and tail sloughing) was attributable to

the HS component of the HSD resuscitation fluid and is an expected physiological response to large volumes of hypertonic saline. Since the proposed therapeutic dose of HSD is only 4 ml/kg, these findings indicate that there will be minimal adverse effects associated with the therapeutic administration of HSD.

CONCLUSION

The maximum tolerated dose of HSD following acute intravenous administration is less than 28 ml/kg, and the toxicity associated with the HSD administration is consistent with the administration of large volumes of hypertonic saline. Since the proposed therapeutic dose of HSD is only 4 ml/kg, these findings indicate that there will be minimal adverse effects associated with the therapeutic administration of HSD.

Appendix B: ANIMAL DATA

Species: *Mus musculus*

Strain: ICR

Source: Harlan Sprague-Dawley, Inc.
P.O.Box 29176
Indianapolis, IN 46229

Sex: Male and Female

Date of birth: 22 Apr 88

Method of randomization: Weight bias, stratified animal allocation (XYBION Medical Systems PATH/TOX AESLCT Animal Allocation program)

Animals in each group: 10 Males and 10 Females

Condition of animals at start of study: Normal

Body weight range at dosing: Males 18.8 - 36.7 g
Females 21.9 - 30.9 g

Identification procedures: Neck tag

Pretest conditioning: Quarantine/acclimation 26 May 1988 to
12/13 June 1988 (males/females)

Justification: The laboratory mouse is a standard laboratory model for acute toxicity studies and is accepted by all regulatory agencies.

Appendix C: HISTORICAL LISTING OF STUDY EVENTS

<u>Date</u>	<u>Event</u>
25 May 88	Animals arrived at LAIR. They were sexed, observed for illness, and caged in the GLP Suite. Eighty animals were assigned to the study.
27 May 88	Animals were tagged.
26, 31 May 88 6, 13, 14, 16(a) 17(a), 20(b) 27(b), 28(b) Jun 88	Animals were weighed.
31 May 88	Quality control animals were submitted for necropsy.
26 May 88- 27 Jun 88	Animals were observed twice daily.
9 Jun 88	Remaining animals were randomized into groups.
13, 14 Jun 88	Animals were dosed at approximately 0900 hours. Observations were conducted one, two, and four hours after dosing.
16(a), 17(a) 27(b), 28(b) Jun 88	Food was removed by 0600 hours. Animals were observed for clinical signs at approximately 0730 hours. Animals were delivered to the Necropsy Suite for euthanasia and necropsy.

Appendix D: INDIVIDUAL ANIMAL HISTORIES

The protocol schedule refers to the day of dosing as Day 0. Since XYBION programming refers to the day of dosing as Day 1, a one-day discrepancy exists between the actual study day and the day listed in the Individual Animal Histories. The following table lists the actual study day and the corresponding day which appears in Appendix D under "STUDY DAY/TIME DATA WERE TAKEN".

Appendix F: PATHOLOGY REPORT

GLP Study 88001

Principal Investigator: CPT Denzil Frost
Co-Principal Investigator: CPT Gary Zaucha
Pathologist: MAJ David Young

I. INTRODUCTION:

Study: Acute mouse intravenous toxicity test.
Test Compound: Hypertonic Saline/Dextran (HSD)
Animal: Mouse (*Mus musculus*), ICR, 20-25 grams, male
and female.

Dosage Groups:

Group 1: (HSD)	28 ml/kg
Group 2: (Hypertonic Saline)	28 ml/kg
Group 3: (Dextran 70)	28 ml/kg
Group 4: (Lactated Ringer's)	28 ml/kg

II. SUMMARY OF PROCEDURES:

Euthanasia: Sodium pentobarbital, IP (One subgroup at
72 hrs; one subgroup at 14 days)
Fixative: 10% Neutral Buffered Formalin
Histopathology: Routine.

III. GROSS FINDINGS:

Table 1 lists animals from all groups with recorded
gross lesions. No gross lesions were considered to be
related to the test compounds.

IV. MICROSCOPIC FINDINGS:

Tissues saved for microscopic examination from all
groups include brain, heart, liver, lung, spleen and kidney.

Table 2 lists the incidence summary (with percentages)
for all microscopic observations. The most frequent lesions
were present in the lungs (congestion) and liver (subacute
minimal hepatitis). Multiple findings of lower incidence
include hepatic sinusoidal congestion and renal cortical
myxoids, often with an associated minimal subacute interstitial
nephritis. Single cases of cardiac myofiber mineralization,
hepatic necrosis and renal pelvis mononuclear infiltrate were
present.

Appendix F (cont.): PATHOLOGY REPORT

The incidence summary for microscopic observations of nonneoplastic graded diagnoses are listed on Table 3. Analysis of these findings using the Kolmogorov-Smirnov two-tailed test revealed no significant differences at the 0.05 level. Annex A lists the individual animal report of gross and microscopic diagnoses.

V. SUMMARY COMMENTS:

The etiology of the single case of mild hepatic necrosis was not determined. The multiple cases of minimal and often focal hepatitis were most consistent with liver lesions caused by mouse hepatitis virus. The pulmonary and hepatic sinusoidal congestion indicated local variation in vascular perfusion and was most likely a consequence of exsanguination while under barbiturate anesthesia. Other lesions observed in these mice were interpreted as incidental findings of little to no clinical significance. No lesions were considered related to the test compound or procedure.

Appendix F (cont.): PATHOLOGY REPORT

GLOSSARY OF MICROSCOPIC FINDINGS

HEART

1. Mineral deposition - Cardiac myofibers are replaced by multiple and variable amounts of mineral, with an absence of inflammatory response. A few adjacent myofibers are degenerative. Coded as present.

LUNGS

1. Perivasculitis/vasculitis - Arterioles are surrounded by neutrophils and few lymphocytes. The neutrophils are present and marginated within the lumen of the vessel and are transmigrating through the vascular wall. A minimal amount of hyaline necrosis is present within the vessel wall. Severity grades are as follows:

Trace = Small, widely scattered foci not to exceed three foci per lung section.

Mild = Four to six small foci of inflammatory cells.

Moderate = Seven to ten small foci or presence of three more foci with extension of inflammation into the pulmonary parenchyma (alveolar regions).

Marked = More than ten small foci or more than four large foci.

2. Congestion - Vascular spaces are distended with large amounts of blood. Coded as present when the congestion constitutes a prominent histologic characteristic.

LIVER

1. Sinusoidal congestion - See lungs.

2. Necrosis - Discrete areas of hepatocellular architectural disruption contain cells with nuclear and cytoplasmic changes with retention of their cellular outlines. Cytologic changes include pyknosis and loss of nuclei with an eosinophilic swelling of the cytoplasm. Few inflammatory cells, consisting of neutrophils and lymphocytes are present. Severity grade criteria for this lesion are as follows:

Trace = Necrotic area is no larger than a 40x microscopic field.

Mild = Combined areas of focal or multifocal necrotic lesions are less than 10% of the liver section.

Moderate = Combined areas of focal or multifocal necrotic lesions are 10% - 20% of the liver section.

Appendix F (cont.): PATHOLOGY REPORT

Marked = Combined areas of focal or multifocal necrotic lesions are 20% - 40% of the liver section.

Severe = Combined areas of focal or multifocal necrotic lesions are greater than 40% of the liver section.

3. Hepatitis - Subacute inflammatory lesions in the liver consist of small focal accumulations of neutrophils, lymphocytes and macrophages within the hepatic parenchyma. Individual cell necrosis or degeneration of hepatocytes within these inflammatory foci are occasionally observed. Severity grade criteria are based on the number of inflammatory cell foci present:

Trace = One to three foci.

Mild = Four to ten foci.

Moderate = Ten to twenty foci.

Marked = More than twenty foci.

KIDNEYS

1. Cortical cysts - One or more cystic spaces are present within the renal cortex. The cysts are lined by flattened epithelium and may be empty or filled with pale homogenous eosinophilic fluid. Coded as present.

2. Interstitial nephritis - Interstitial accumulation of lymphocytes, macrophages and few neutrophils are primarily and almost exclusively associated with and abutting the cortical cysts. Severity grade criteria are as follows:

Trace = Small foci not to exceed three per kidney section.

Mild = Four to six small foci.

Moderate = Seven to ten small foci or the presence of three or more foci with extension into and obliteration of renal tubules and glomeruli.

Marked = More than ten small foci or more than four large foci.

3. Mononuclear cell infiltrate - Focal infiltration of macrophages and lymphocytes are immediately subjacent to the urothelium of the renal pelvis. Severity grade criteria are as follows:

Trace = One to two small foci.

Mild = Three to five small foci.

Moderate = Six to ten small foci or one to three larger foci not exceeding a 40x microscopic field.

Marked = More than ten small foci or more than four large foci.
